- 5 years of software engineering experience including in Hadoop Architecture, NIFI , Hive, Sqoop , Spark, Scala, Java
- Good understanding of Hadoop architecture and various components such as HDFS, JobTracker, TaskTracker, NameNode and DataNode
- Developing spark components in Scala using data frames to ingest Oracle data into Hive
- Developing end of day reconciliation process in spark involving various business logics and to create recon report with matched records count between source and lake
- Experience with working with various file formats like Avro, ORC, XML
- Implementing high performance 5 node NiFi ingestion framework POT which outperformed client's requirement two times over
- Build custom processors to fit in the customer specific transformation
- Developing RESTful API for NiFi Deployment automation (Continuous Delivery / Continuous Integration)
- Experience in Data File ingestion in Hive
- Experience in working with Hive 0.13.1 and Hadoop 2.4
- Experience using different software development methodologies like Waterfall model and Agile development. Excellent communication skills and ability to work effectively in a team as well as individually in a fast paced environment
- Proven results in meeting aggressive timelines and working independently and as a coherent team member
- Proven a card in requirements definition and story grooming sessions
- Proven results in meeting aggressive timelines and working independently and as a coherent team member

My industry experience includes business process reengineering, project management, cost estimating, financial accounting, capital planning, and contract analysis. I also have experience in applications definition, development, and testing.

Highlights of Professional Experience

Capgemini -
Consultant (B2)
Client : Manulife
May 2018 - Present

- NiFi Developer for a finanacial data lake Proof of Technology project which takes in the data from different data sources and migrate to Canonical Database.
- Integration of Kafka to publish and capture of huge data volumes into microservices.
- Responsible for customizing and implementing NiFi framework for building the Ingestion framework to import data from different data sources.
- Explore the extent of customization needed in NiFi tool to build the base framework for Automation
- Integrating Kafka live Streaming development to gain productivity by 20-30% compared to traditional data pipelines
- Analyze and understand the application architecture, design the re-usable components, understand the application breakdown structure, functionality & technology

Bitwise Solution Private Ltd
Programmer
Client : Discover Financial Services
Project : Data Centralization
Duration : Januray 2014 – October 2017

- Responsible for architecture and designed from scratch a Data Lake using HDP2.1 The lake is intended to source data, perform any cleansing or standardization, identify any delta(CDC) and store the data in structures that are conducive for consumption by Data Warehouses and other applications.
- Responsible for building an automated data pipeline to migrate data from TeraData server, and warehouse data in Hive and designing data lake that supports both real-time as well as batch ingestions using next generation Ingestion framework Apache Nifi
- Responsible for making the data lake completely metadata driven with integrated business and technical metadata captured at all stages, from different data sources like SQL, Oracle and unstructured data like flat files
- SME for implementation of data lakes using NiFi
- Responsible for Interacting with Business Analysts/business users for gathering the business requirements.
- Write Shell script to automate the ingestion framework
- Responsible for performance tuning of NiFi flow and set of high performance 5 node cluster
- Creating an efficient cataloging mechanism to maintain data record in Posiedon
- Developer to build a frmaework to analyze large volume of data can be gathered through different data sources, to help interpret the data and generate reports for specific areas of user interest
- Use of Spark jobs for transformation and then migrating data using NiFi was an innovation done, which helped in making Data Lake more organized and efficient
- Responsible for integrating Data Lake to dashboard for reporting purposes
- Write Spark jobs to perform data transformation and use NiFi to warehouse transformed data in Hive
- Perform performance tuning on Hive Queries
- Responsible for elimating the dependancy on Sqoop to warehouse OLTP transactions into Hive
- Build custom NiFi Processor to meet client expectation
- Responsible for designing an efficient error logging mechanism in NiFi Architecture to directly log a tikcet whenever a flow file fails to achieve its traget.
- Responsible for handling backpressure when warehousing OLTP transactions from RDBMS
- Followed strict agile process during the project, daily stand up and 3 weeks sprint followed by all team live demo
- Involved in Status Meetings and suggested new enhancements to the existing application
- Use different file formats like ORC, AVRO

Education and Professional Affiliations

Uttar Pradesh Technical University - Bachelor of Technology 2012
CDAC – Post Graduate Diploma in Advance Computing 2014
